

# Lecture 7: Manufacturing

## CSCOE 5730

## Digital CMOS VLSI Design

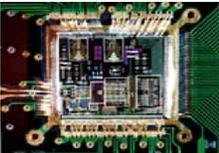

**Instructor:** Saraju P. Mohanty, Ph. D.

**NOTE:** The figures, text etc included in slides are borrowed from various books, websites, authors pages, and other sources for academic purpose only. The instructor does not claim any originality.

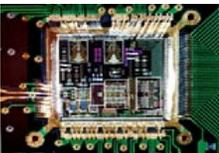

# Lecture Outline

- CMOS Fabrication
- Packaging
- Testing

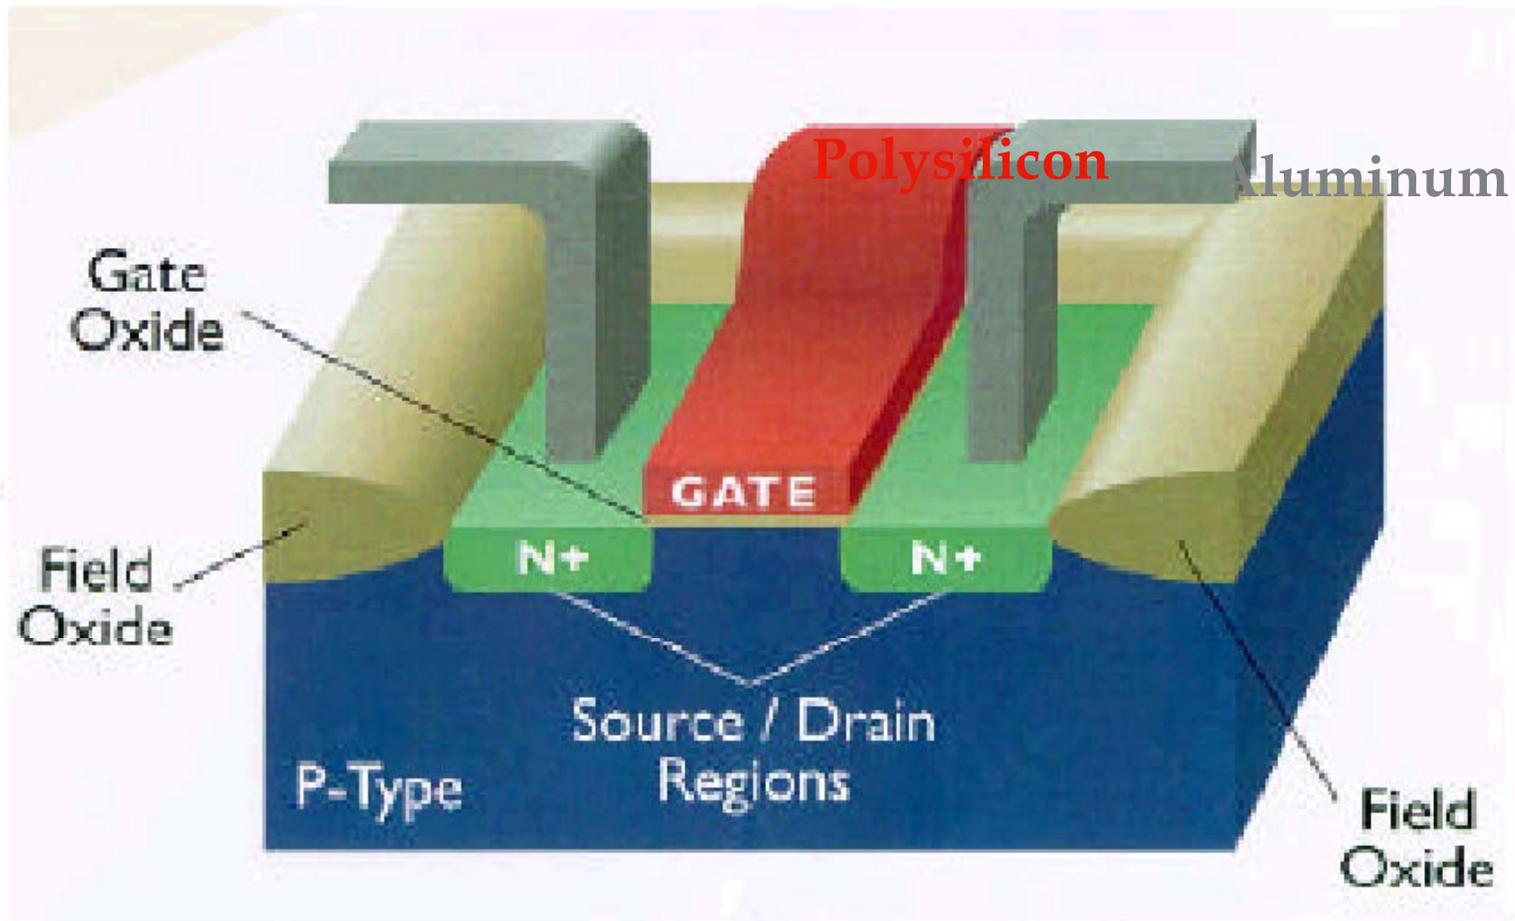

# Introduction

- Integrated circuits: many transistors on one chip.
- *Very Large Scale Integration (VLSI)*: very many
- *Complementary Metal Oxide Semiconductor*
  - Fast, cheap, low power transistors
- How to build your own simple CMOS chip
  - CMOS transistors
  - Building logic gates from transistors
  - Transistor layout and fabrication

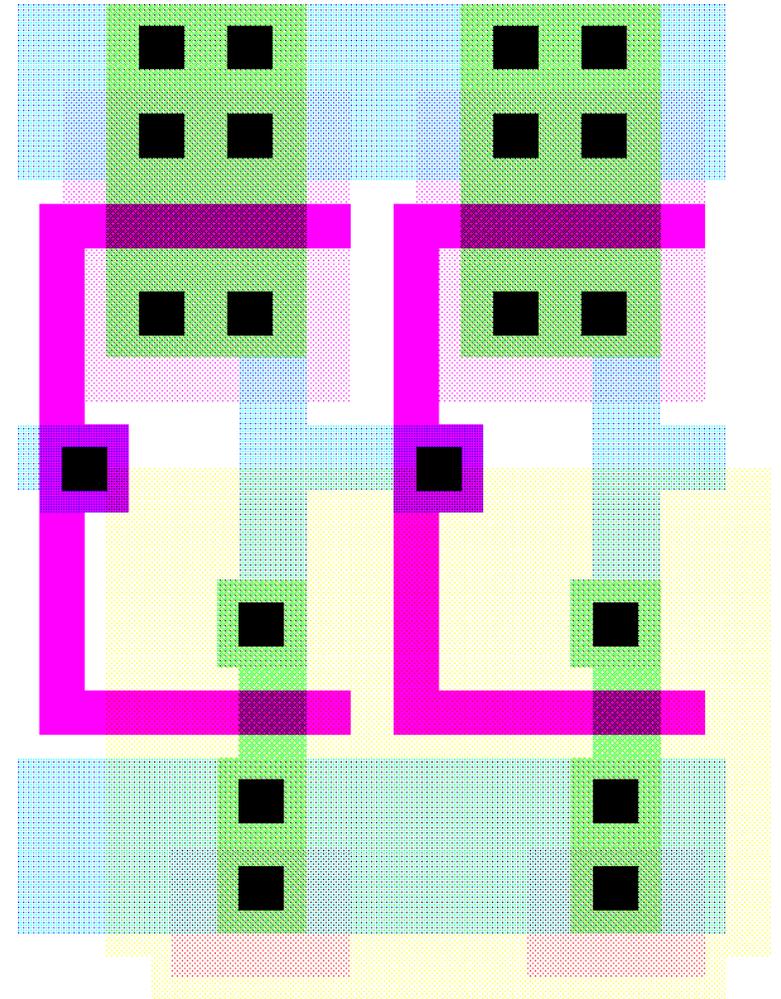

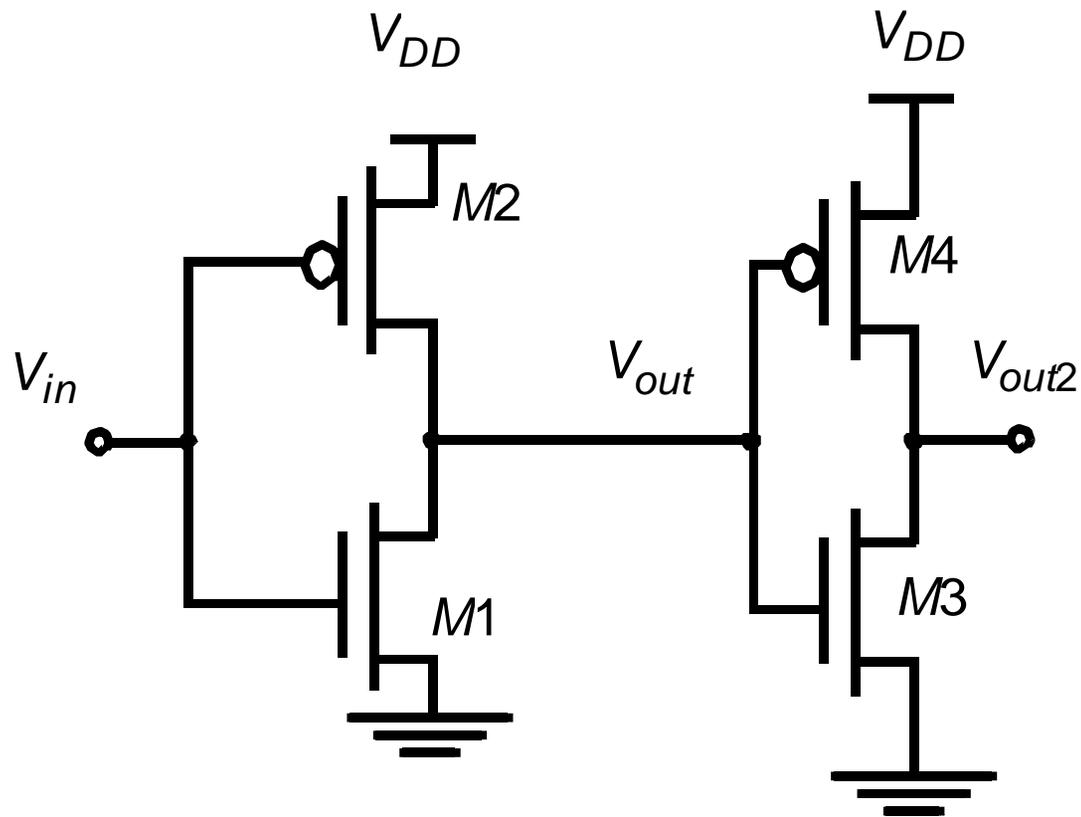

# MOSFET: 3D Perspective

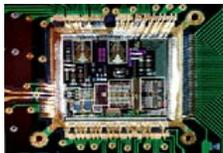

# Circuit Under Design and Its Layout

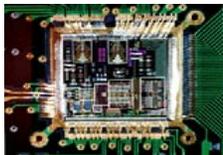

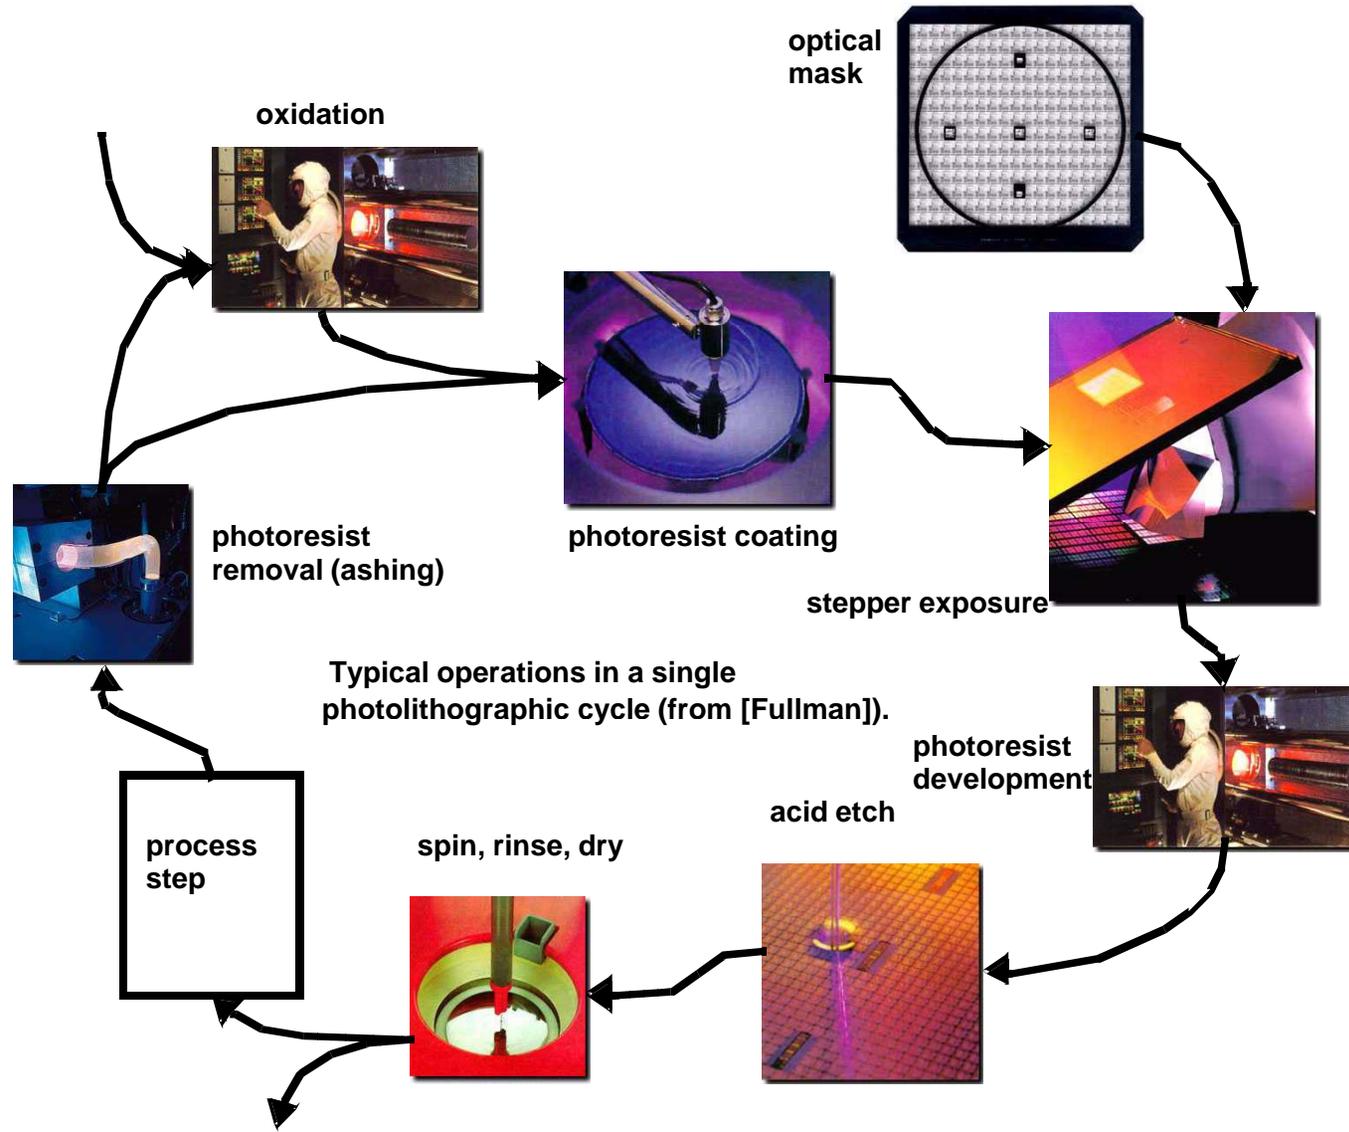

# CMOS Fabrication

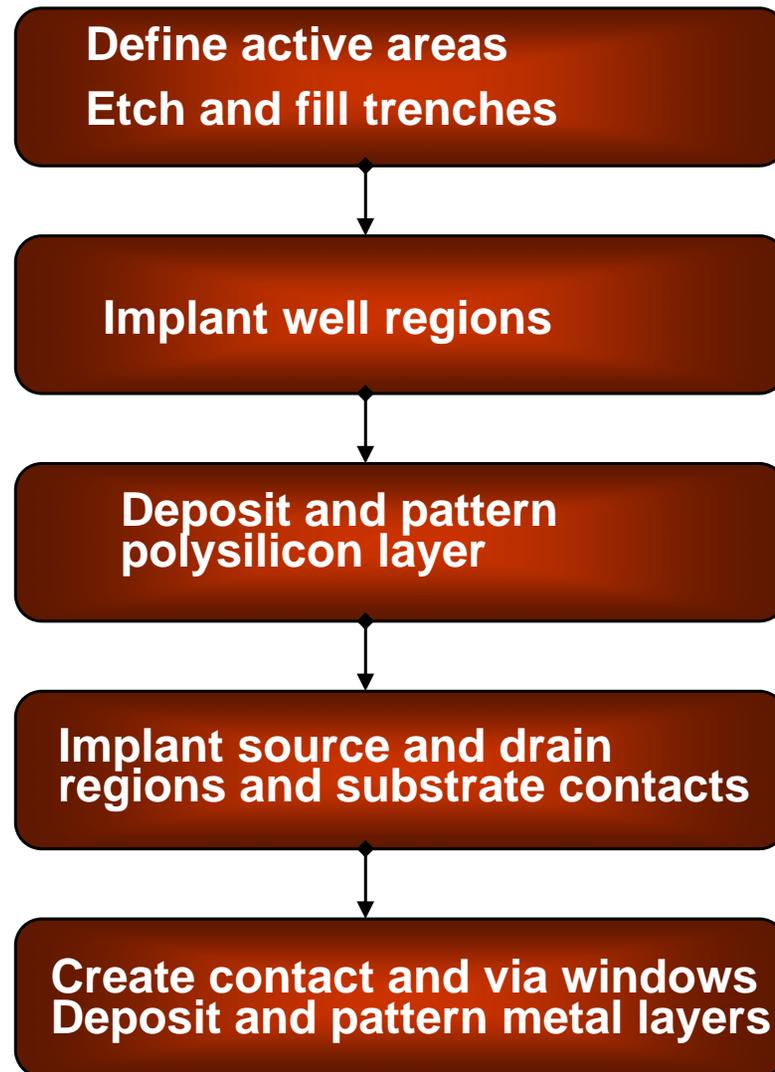

- CMOS transistors are fabricated on silicon wafer.
- Lithography process similar to printing press is used for the fabrication.
- On each step, different materials are deposited or etched.
- Easiest to understand by viewing both top and cross-section of wafer in a simplified manufacturing process.

# Photo-Lithographic Process

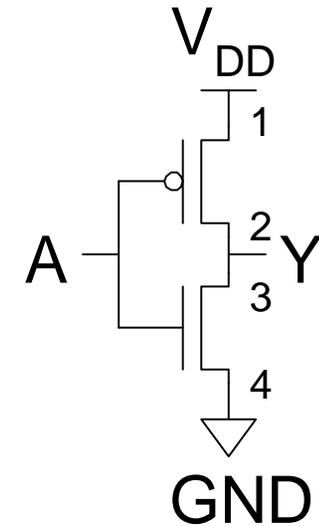

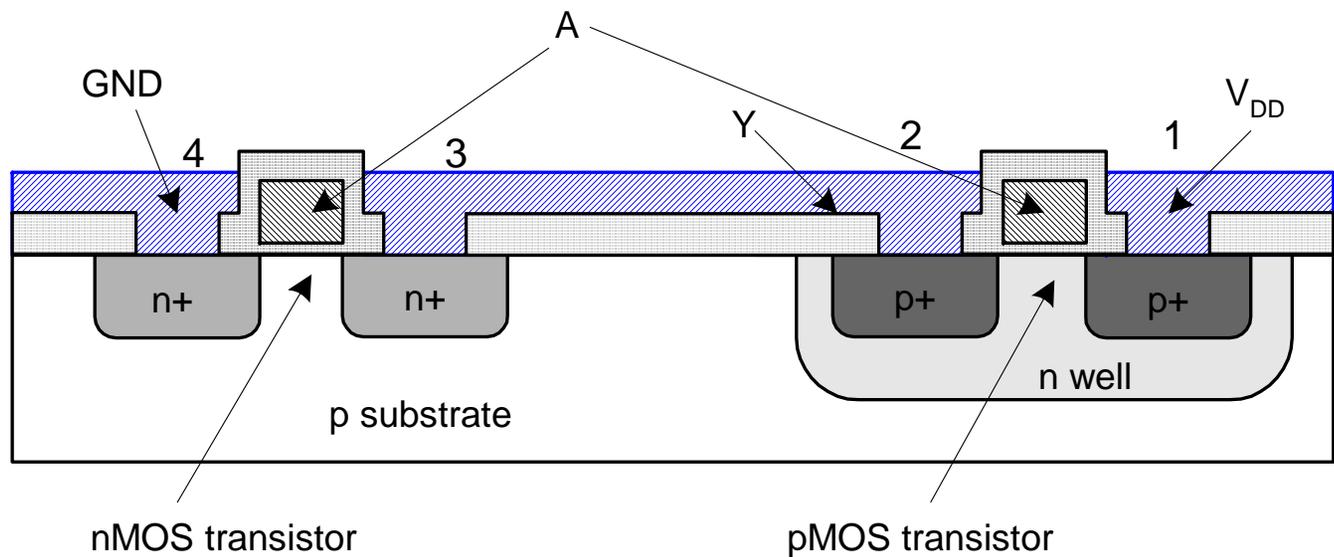

# CMOS Process at a Glance

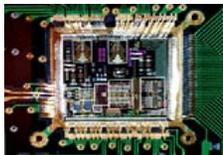

# Inverter Cross-section

- Typically use p-type substrate for nMOS transistors.
- Requires n-well for body of pMOS transistors.

	SiO <sub>2</sub>
	n+ diffusion
	p+ diffusion
	polysilicon
	metal1

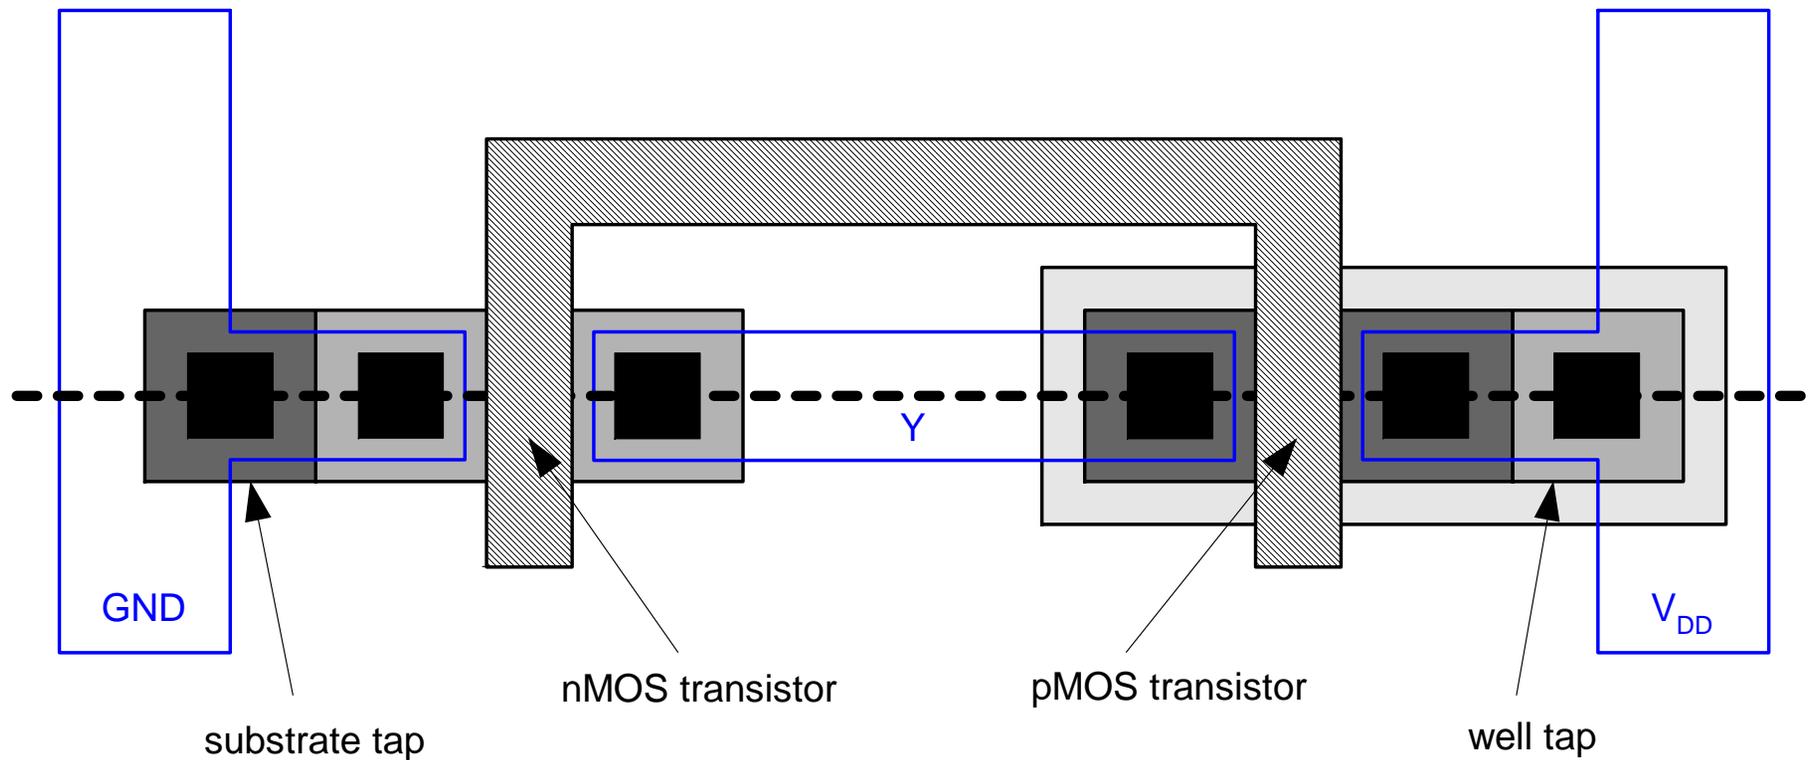

# Well and Substrate Taps

- Substrate must be tied to GND and n-well to  $V_{DD}$
- Metal to lightly-doped semiconductor forms poor connection called Schottky Diode
- Heavily doped well and substrate contacts or taps form good ohmic contacts.

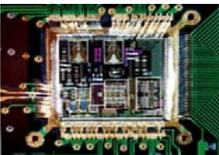

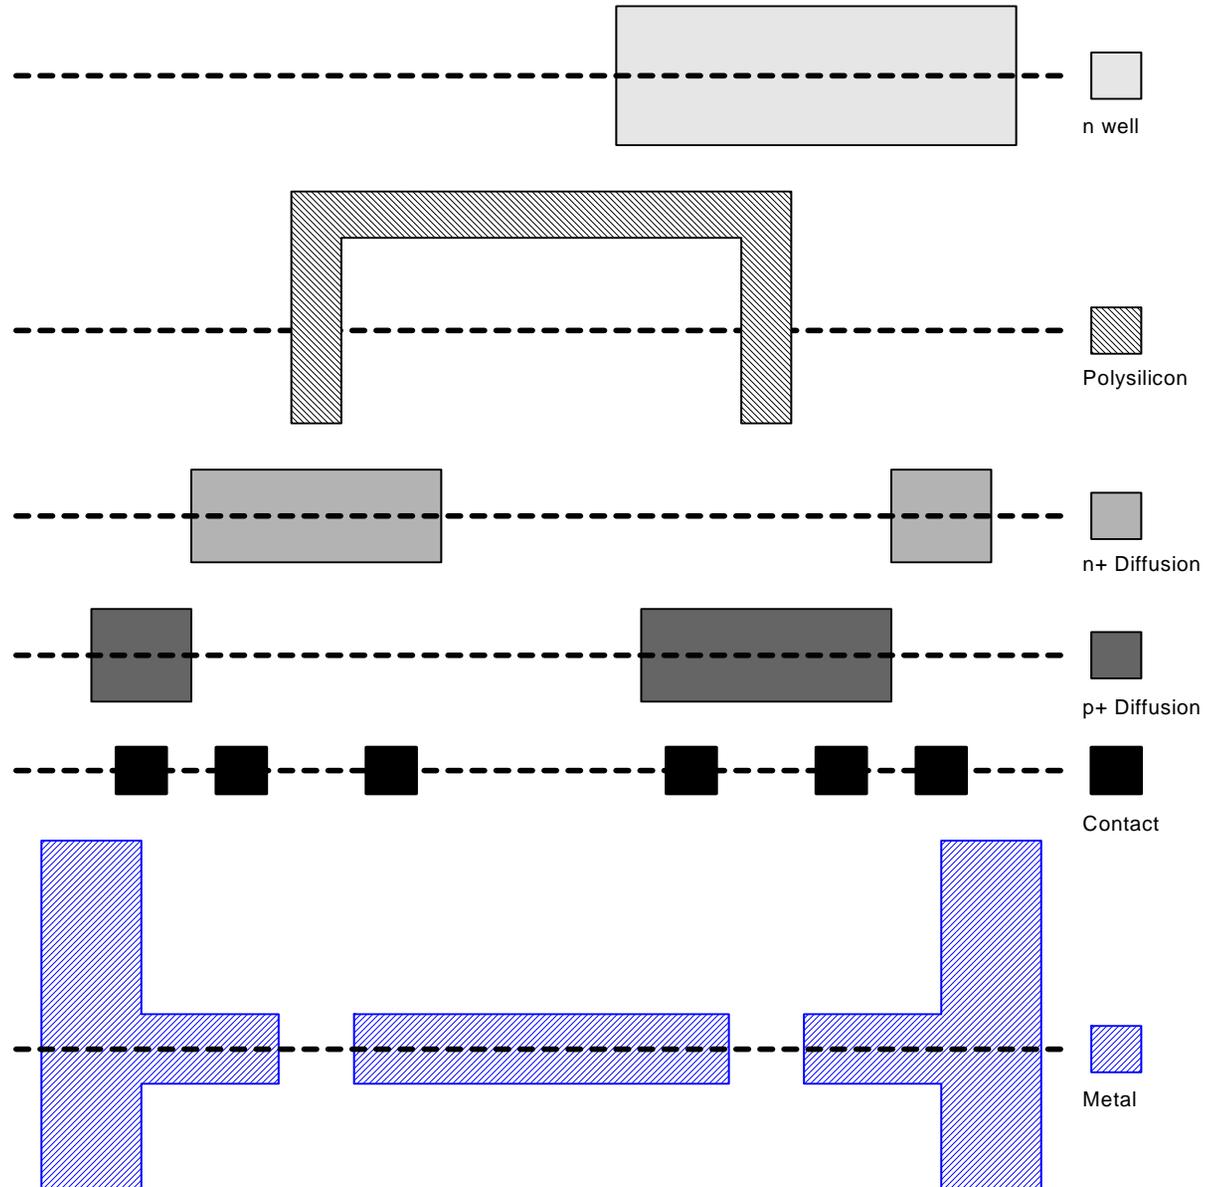

# Inverter Mask Set

- Transistors and wires are defined by *masks*
- Cross-section taken along dashed line

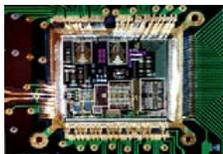

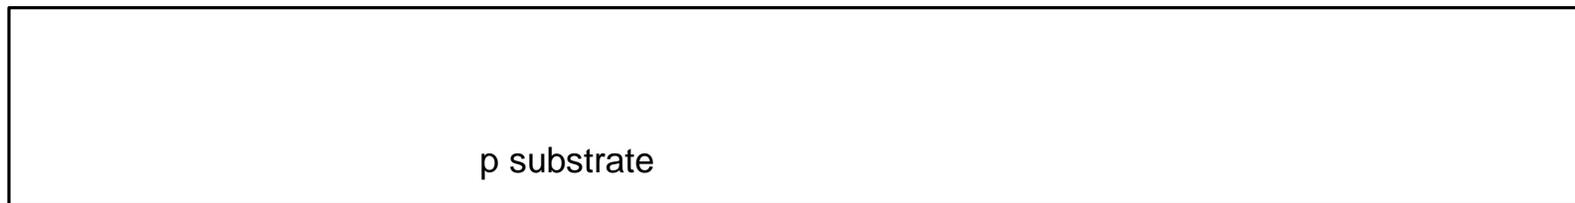

# Detailed Mask Views

- Six masks
  - n-well
  - Polysilicon
  - n+ diffusion
  - p+ diffusion
  - Contact
  - Metal

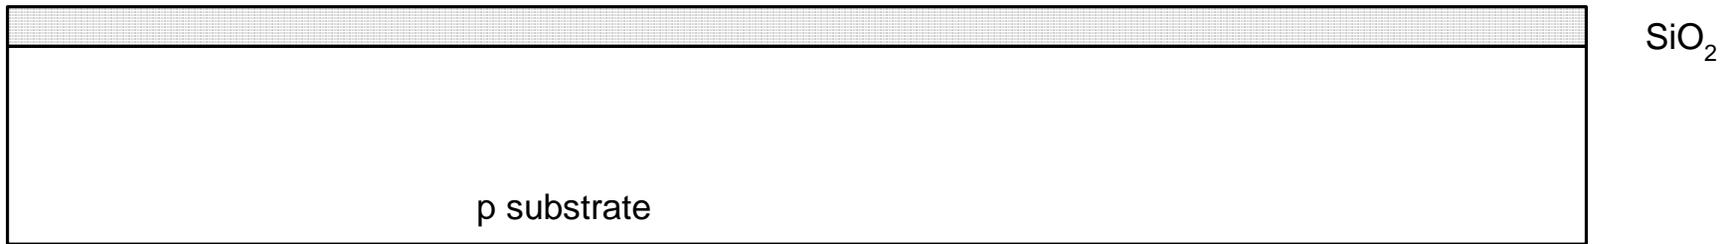

# Fabrication Steps: Creation of n-well

- Objective is to build inverter from the bottom up
- First step will be to form the n-well
  - Cover wafer with protective layer of  $\text{SiO}_2$  (oxide)
  - Remove layer where n-well should be built
  - Implant or diffuse n dopants into exposed wafer
  - Strip off  $\text{SiO}_2$
- n-well : Start with blank p-type silicon wafer

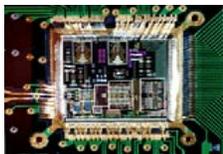

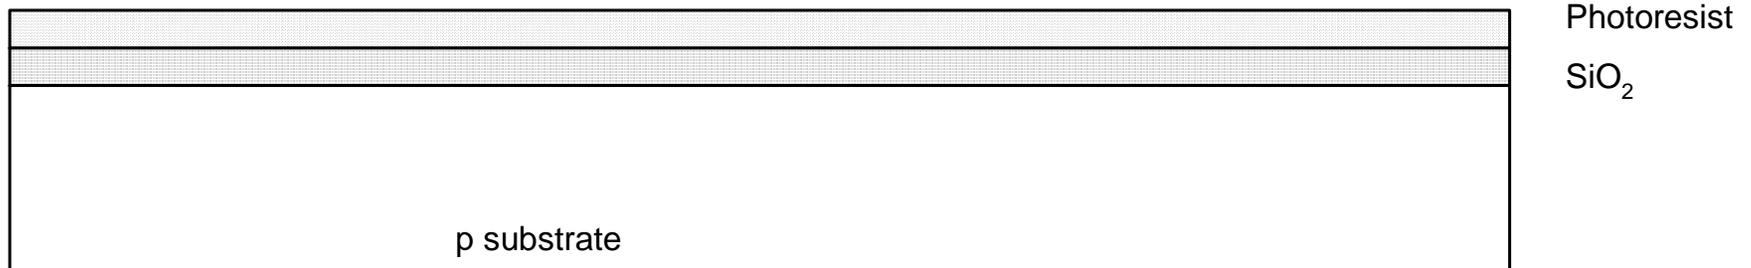

# Fabrication Steps: Creation of n-well

- n-well: Grow  $\text{SiO}_2$  on top of Si wafer
  - 900 – 1200 C with  $\text{H}_2\text{O}$  or  $\text{O}_2$  in oxidation furnace
  - The oxide is patterned to define n-well.

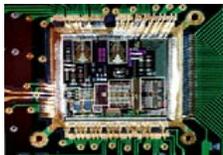

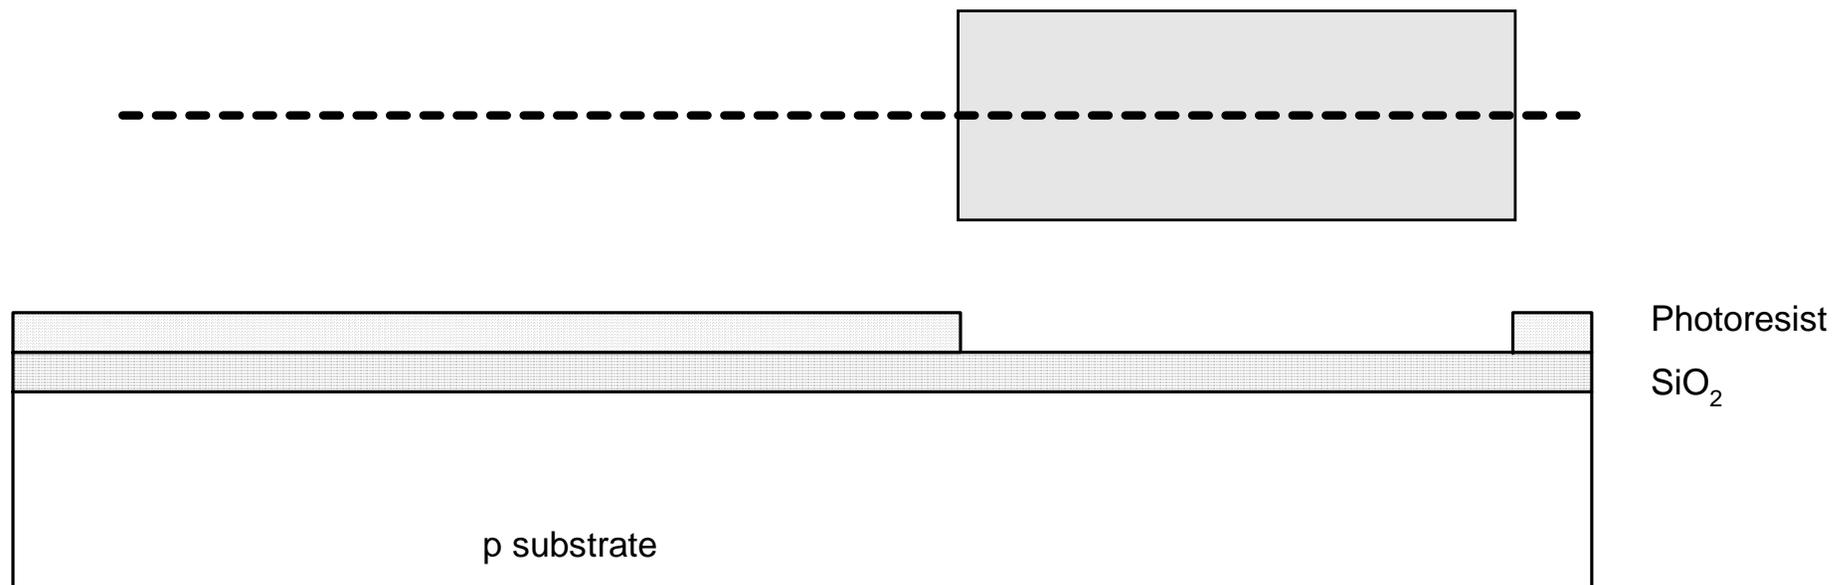

- n-well: Spin on photoresist
  - Photoresist is a light-sensitive organic polymer
  - Softens where exposed to light

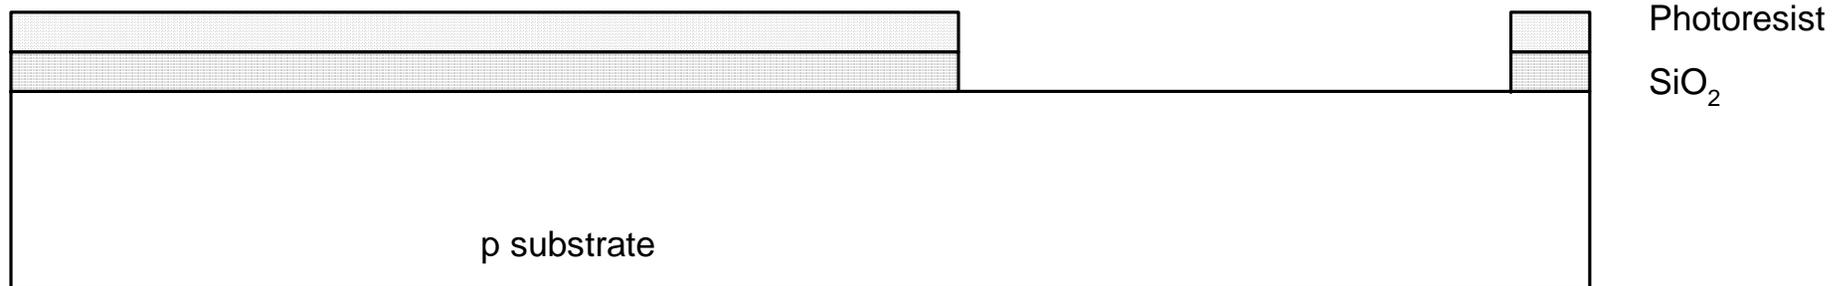

# Fabrication Steps: Creation of n-well

- n-well: Expose photoresist through n-well mask
  - Allows light to pass through only where the n-well need to be created.
  - Strip off exposed photoresist

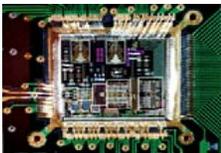

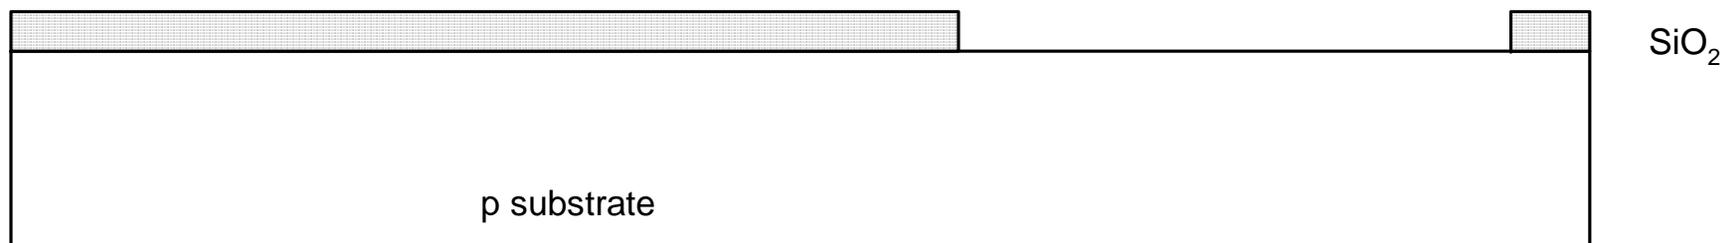

# Fabrication Steps: Creation of n-well

- n-well: Etch oxide with hydrofluoric acid (HF)
  - Only attacks oxide where resist has been exposed

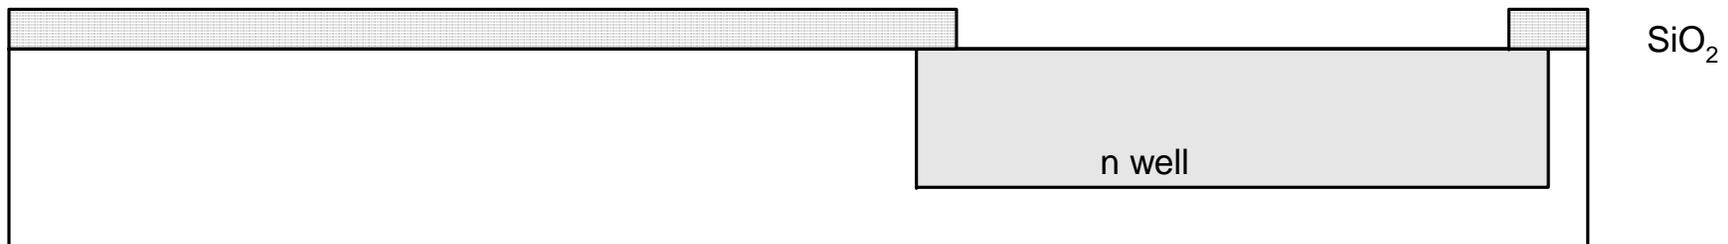

- n-well: Strip off remaining photoresist
  - Use mixture of acids called piranha etch
  - Necessary so resist doesn't melt in next step

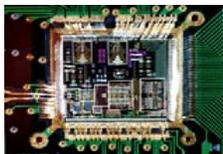

# Fabrication Steps: Creation of n-well

- n-well: created with diffusion or ion implantation
  - Diffusion: Place wafer in furnace with arsenic gas and heat until As atoms diffuse into exposed Si
  - Ion Implantation: Blast wafer with beam of As ions

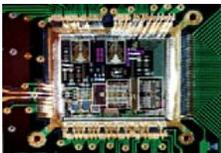

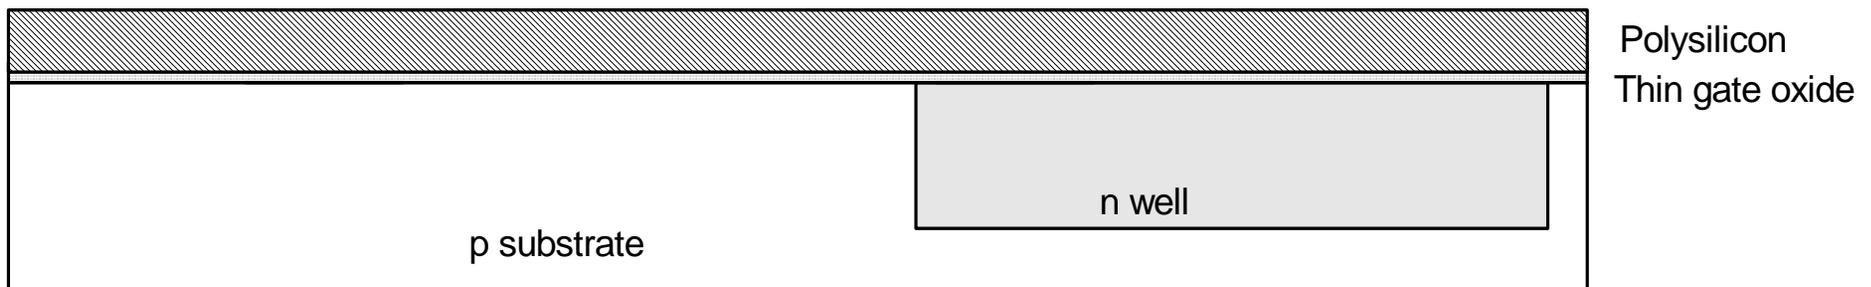

- n-well: Strip off the remaining oxide using HF
  - Back to bare wafer with n-well
  - Subsequent steps involve similar series of steps

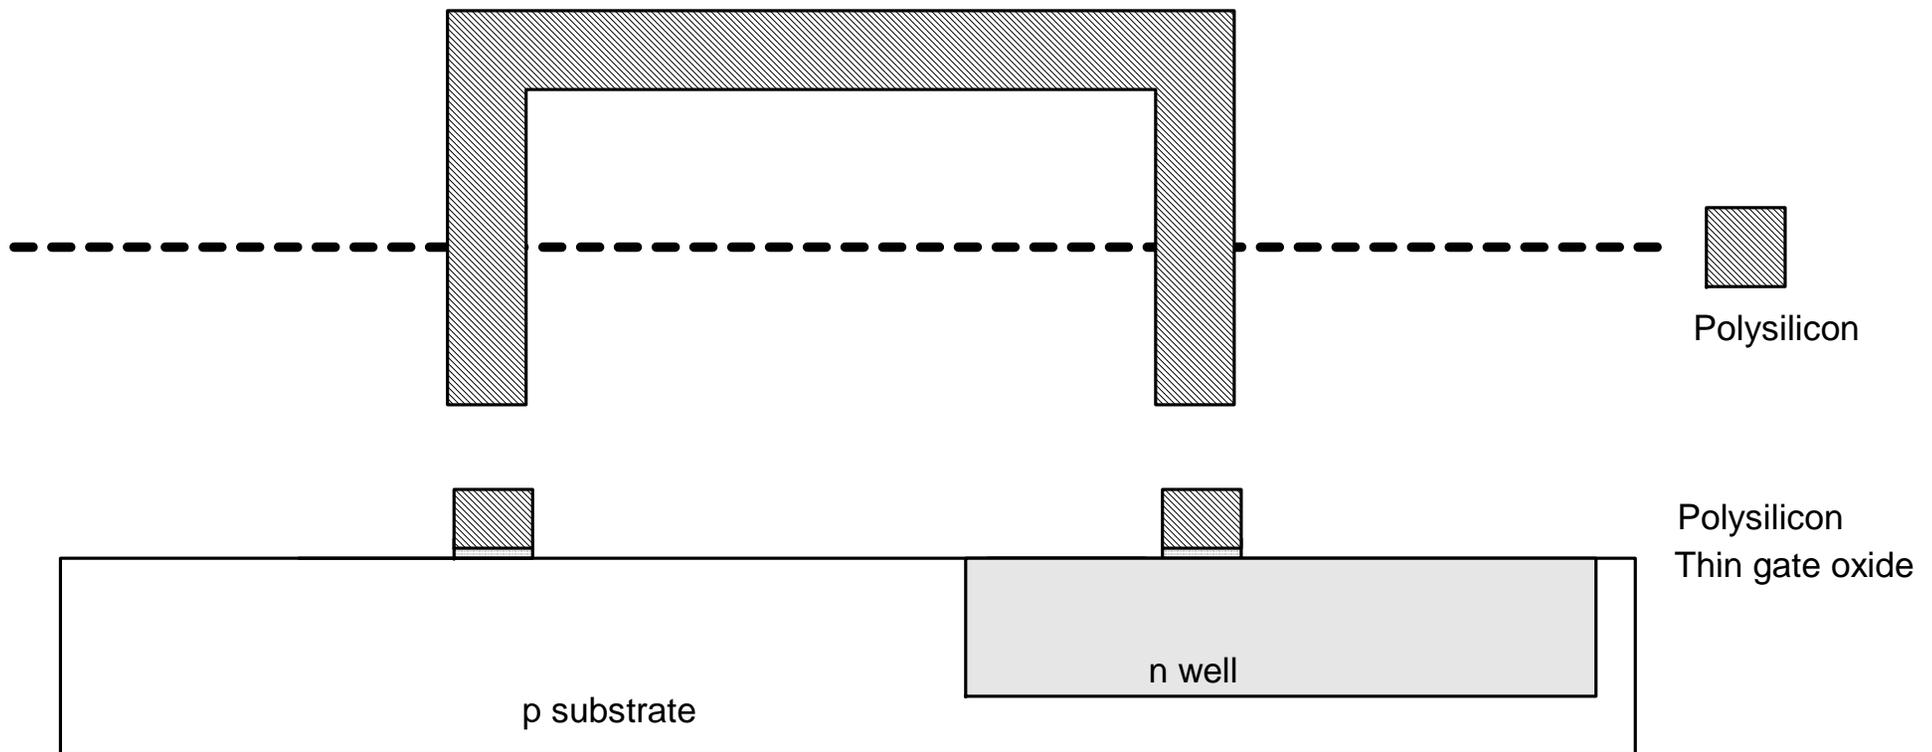

# Fabrication Steps: Creation of Gates

- Gate consists of polysilicon over thin layer of silicon oxide.
- Very thin layer of gate oxide is grown in furnace
  - $< 20 \text{ \AA}$  (6-7 atomic layers)
- Chemical Vapor Deposition (CVD) of silicon layer for polysilicon deposition
  - Place wafer in furnace with Silane gas ( $\text{SiH}_4$ )
  - Forms many small crystals called polysilicon
  - Polysilicon is heavily doped to be a good conductor

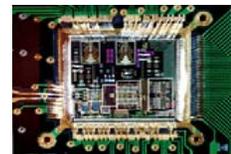

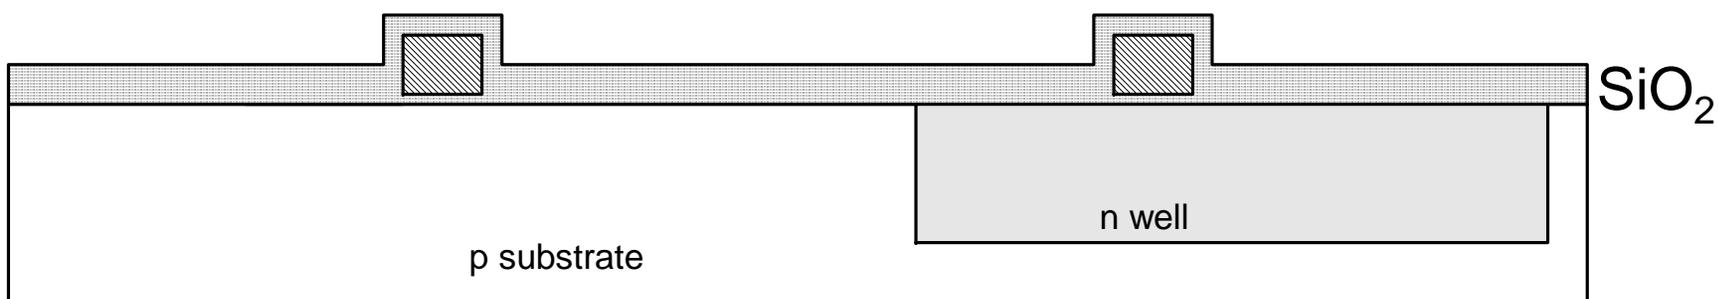

# Fabrication Steps: Creation of Gates

- Use same lithography process that used to create n-well to pattern polysilicon using photoresist and the polysilicon mask.

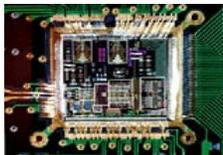

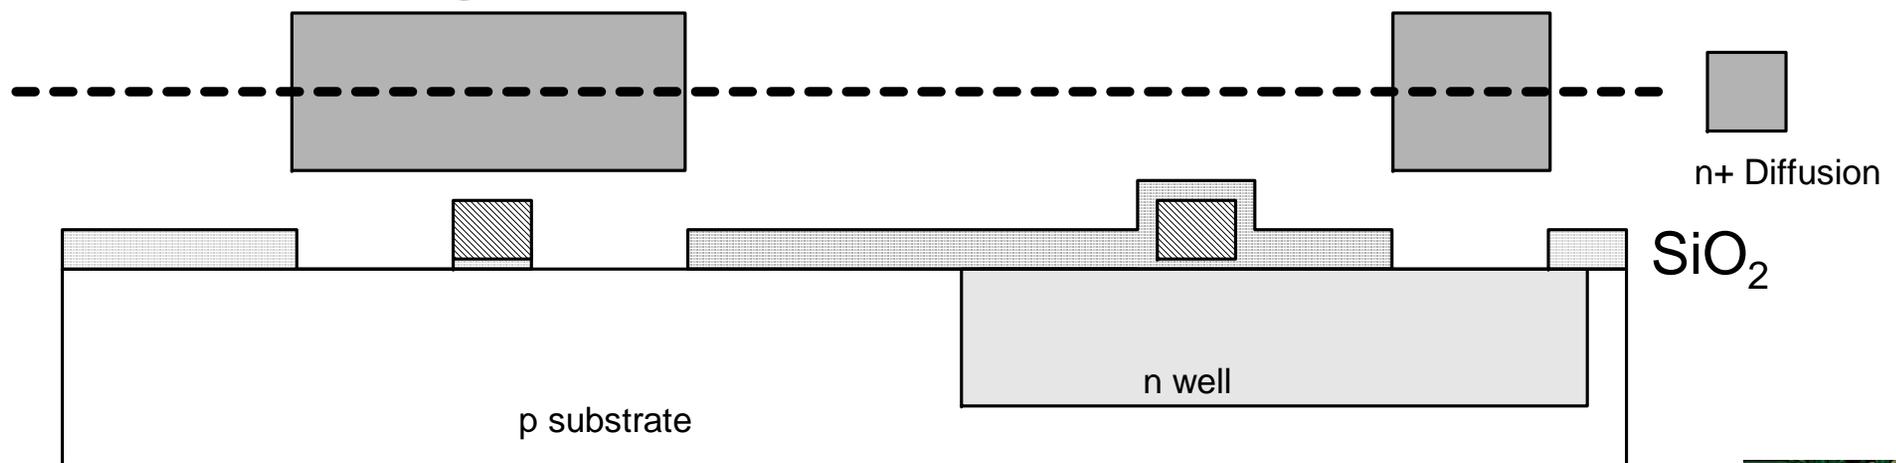

# Fabrication Steps: Creation of n+

- Transistor active area and well contact are n+.
- N-diffusion forms nMOS source, drain, and n-well contact
- Use oxide and masking to expose where n+ dopants should be diffused or implanted

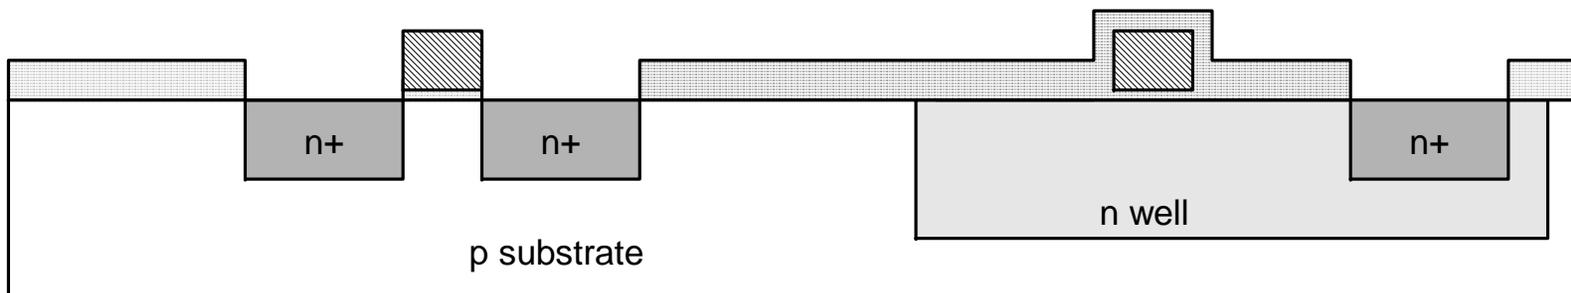

# Fabrication Steps: Creation of n+

- Pattern oxide with the n-diffusion mask and form n+ regions
- *Self-aligned process* where gate blocks diffusion
- Polysilicon is better than metal for self-aligned gates because it doesn't melt during later processing

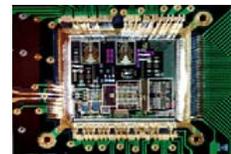

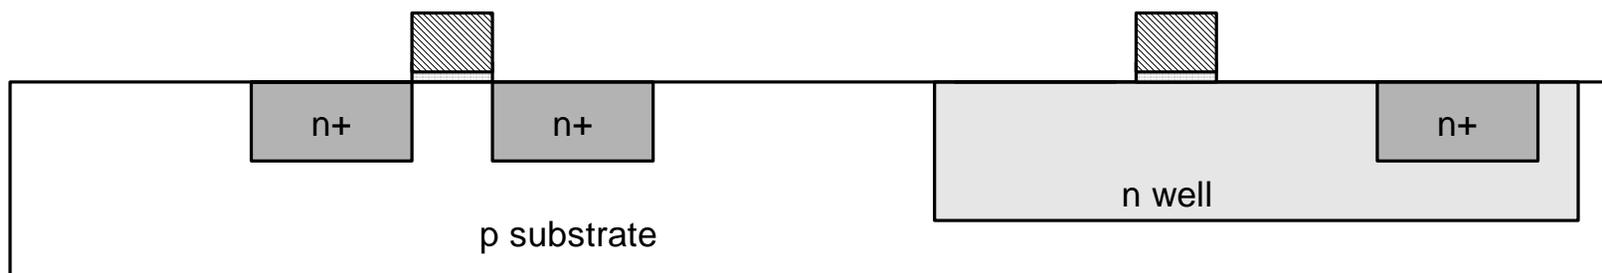

# Fabrication Steps: Creation of n+

- Historically dopants were diffused
- Usually ion implantation today
- But regions are still called diffusion

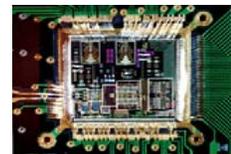

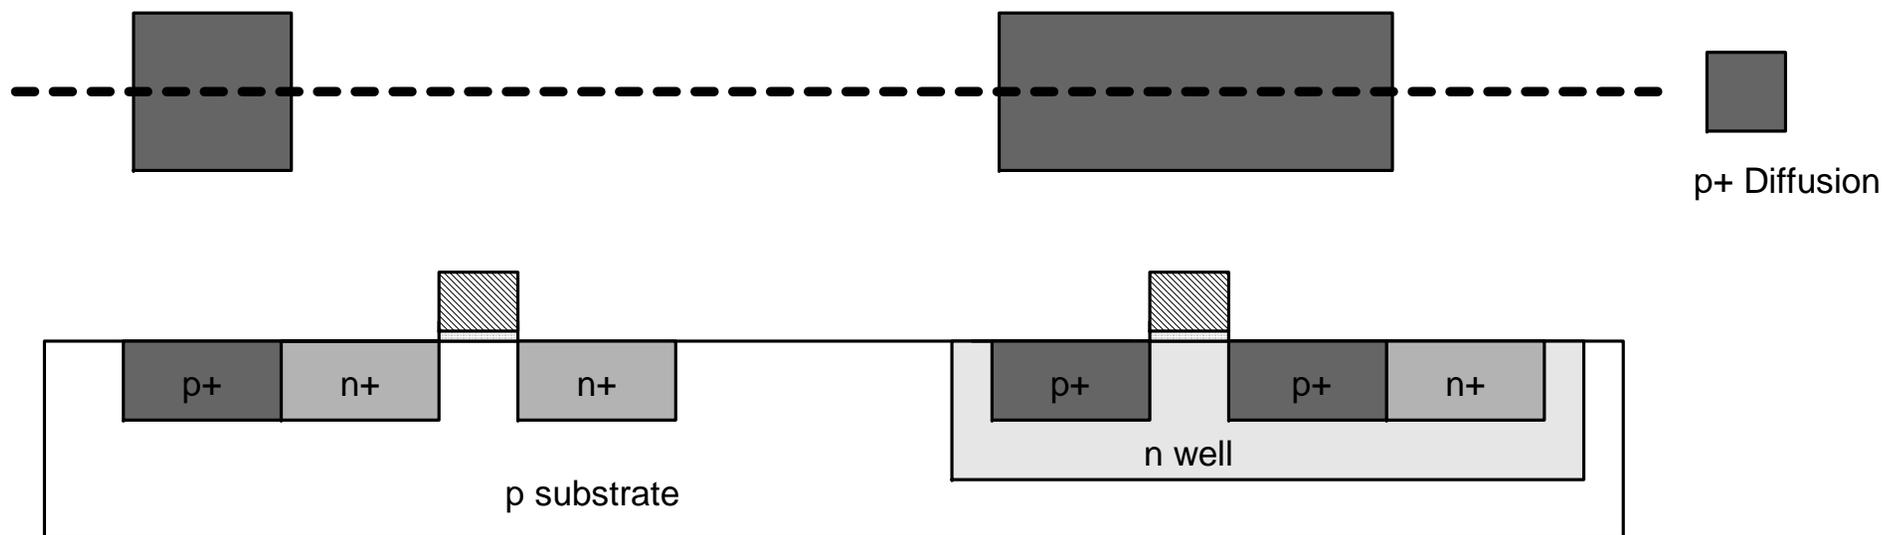

- Strip off oxide to complete patterning step

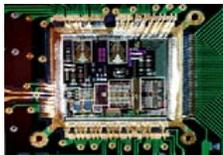

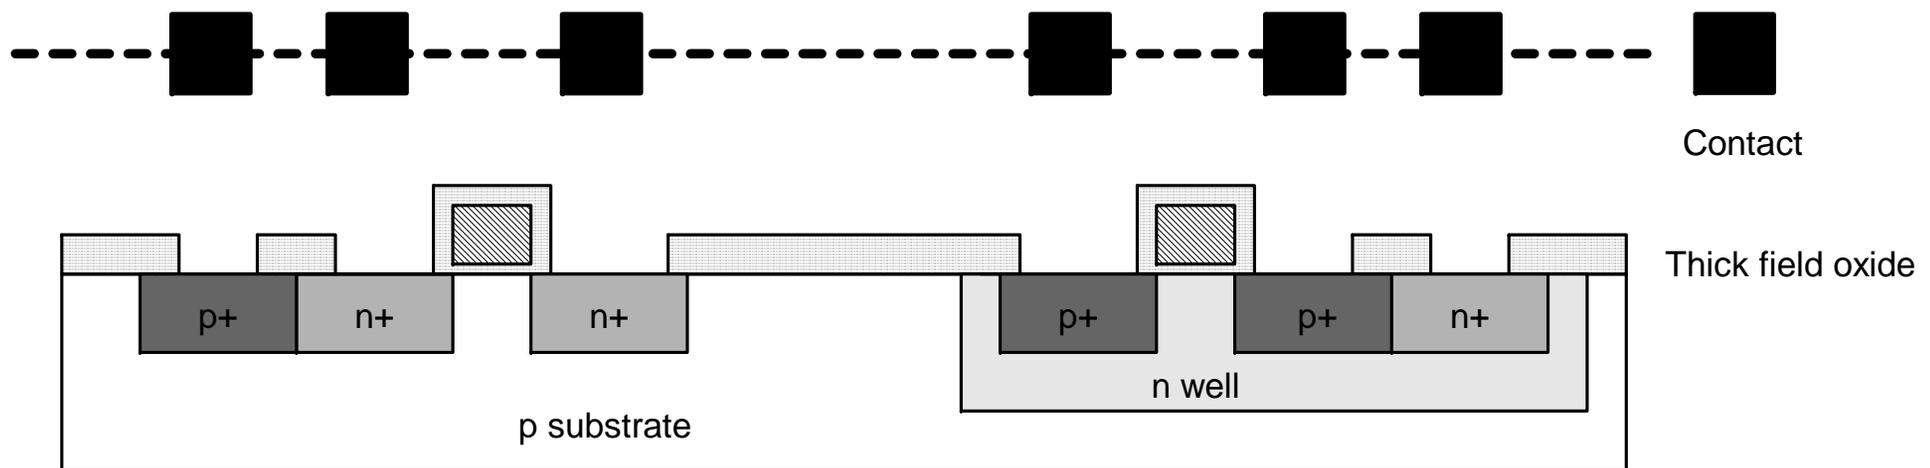

# Fabrication Steps: Creation of p+

- Similar set of steps form p+ diffusion regions for pMOS source and drain and substrate contact
- Pattern oxide with the p-diffusion mask and form p+ regions

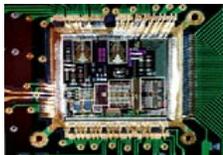

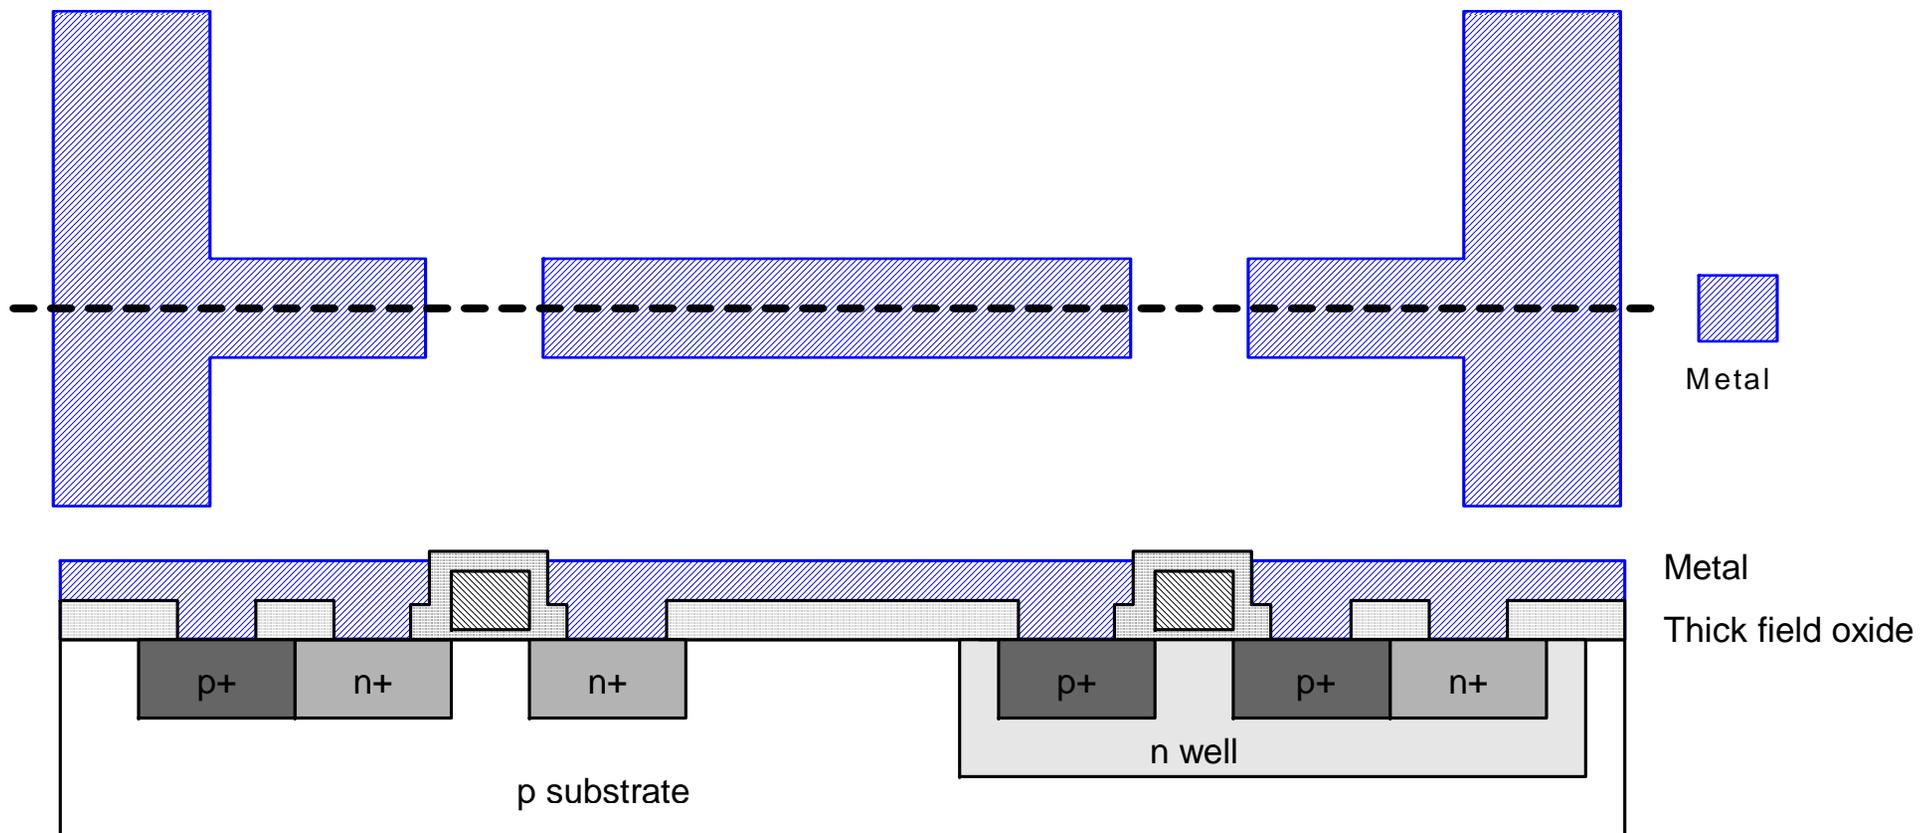

# Fabrication Steps: Creation of Contacts

- Now we need to wire together the devices
- Cover chip with thick field oxide
- Etch oxide where contact cuts are needed using contact mask.

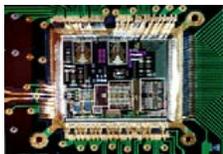

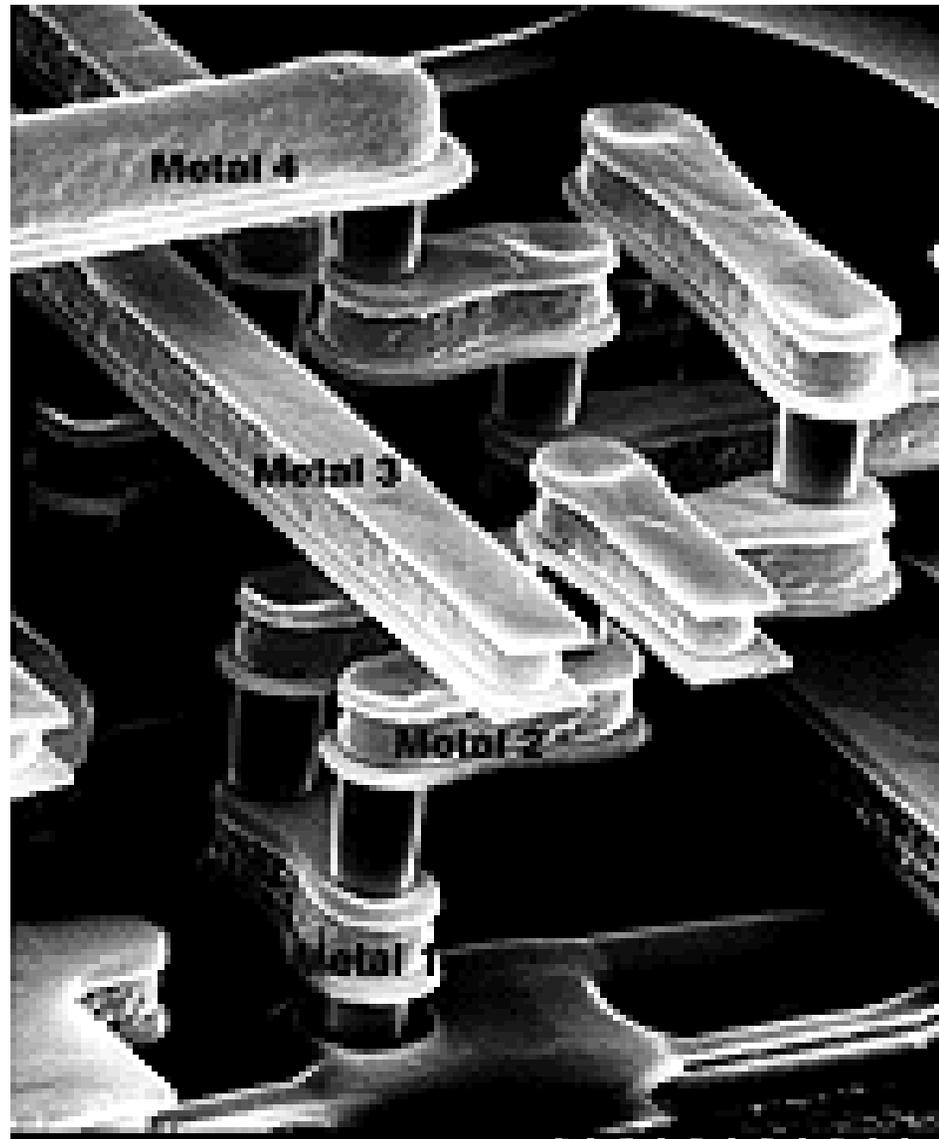

# Fabrication Steps: Metalization

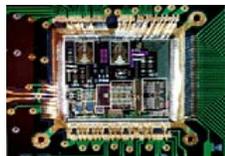

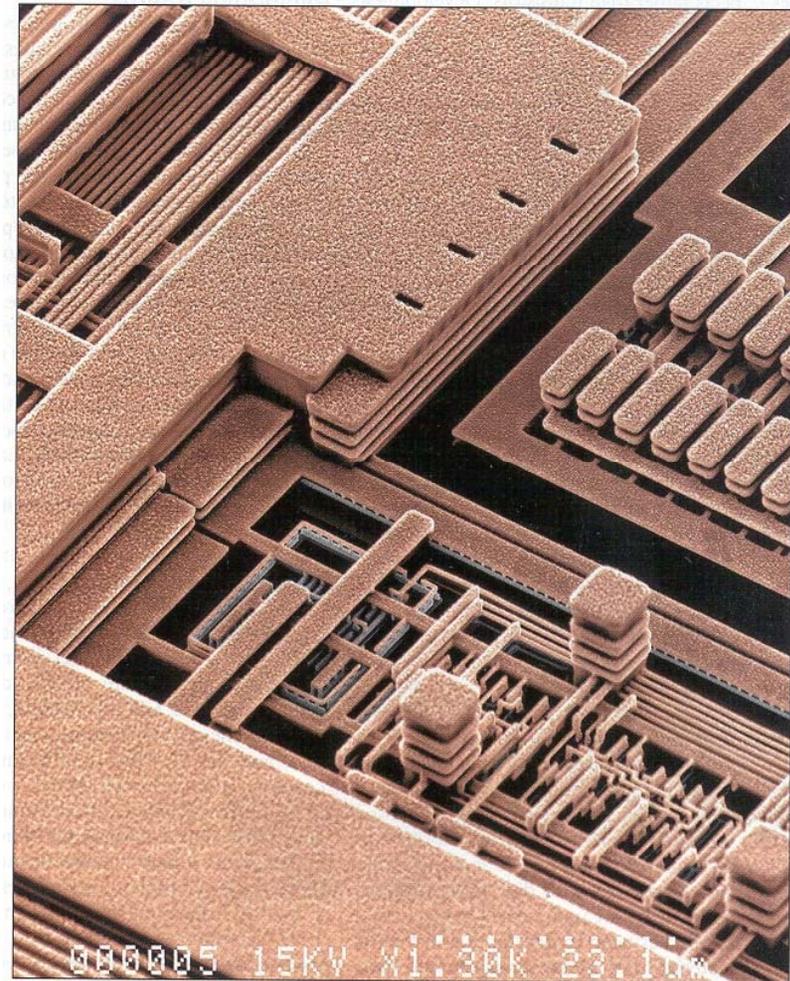

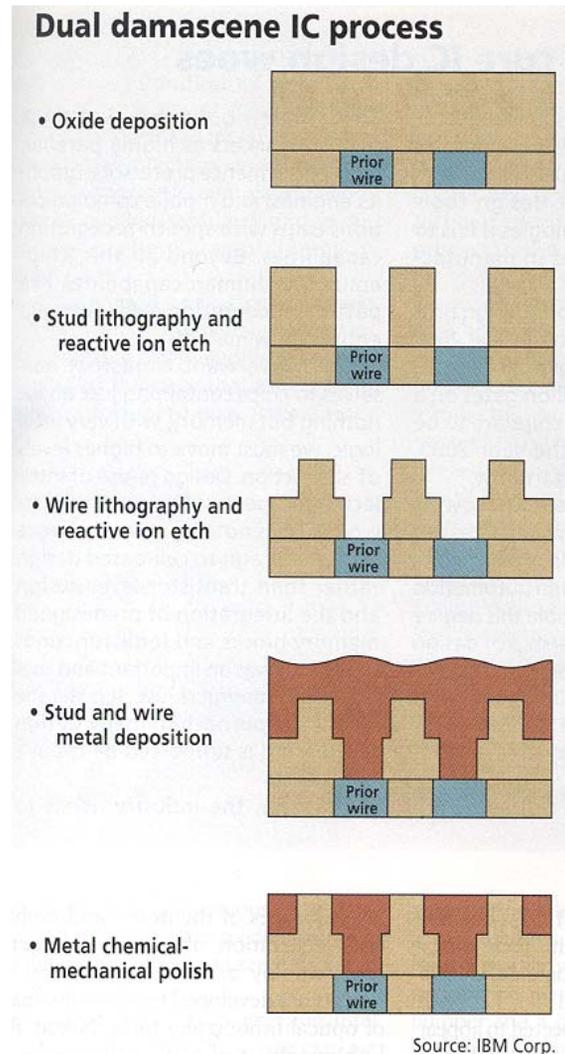

- Sputter on aluminum over whole wafer
- Pattern to remove excess metal, leaving wires
- Metal mask is used during this step.

# Advanced Metallization

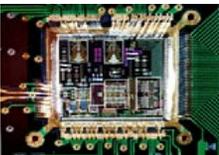

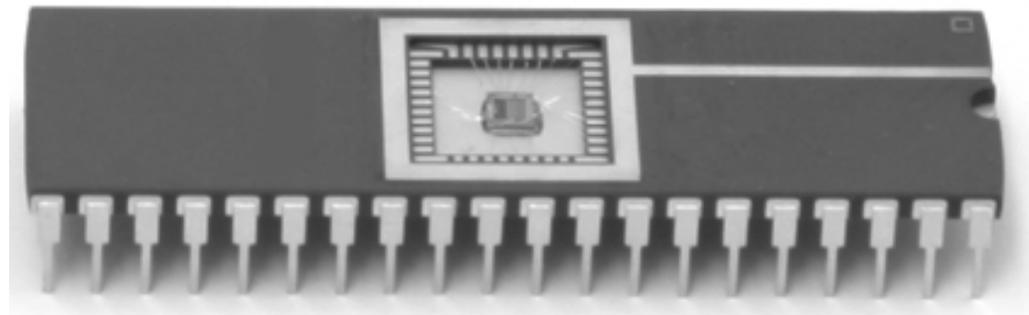

# Advanced Metallization

# Packaging

- Tapeout final layout
- Fabrication
  - 6, 8, 12” wafers
  - Optimized for throughput, not latency (10 weeks!)
  - Cut into individual dice
- Packaging
  - Bond gold wires from die I/O pads to package

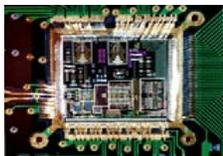

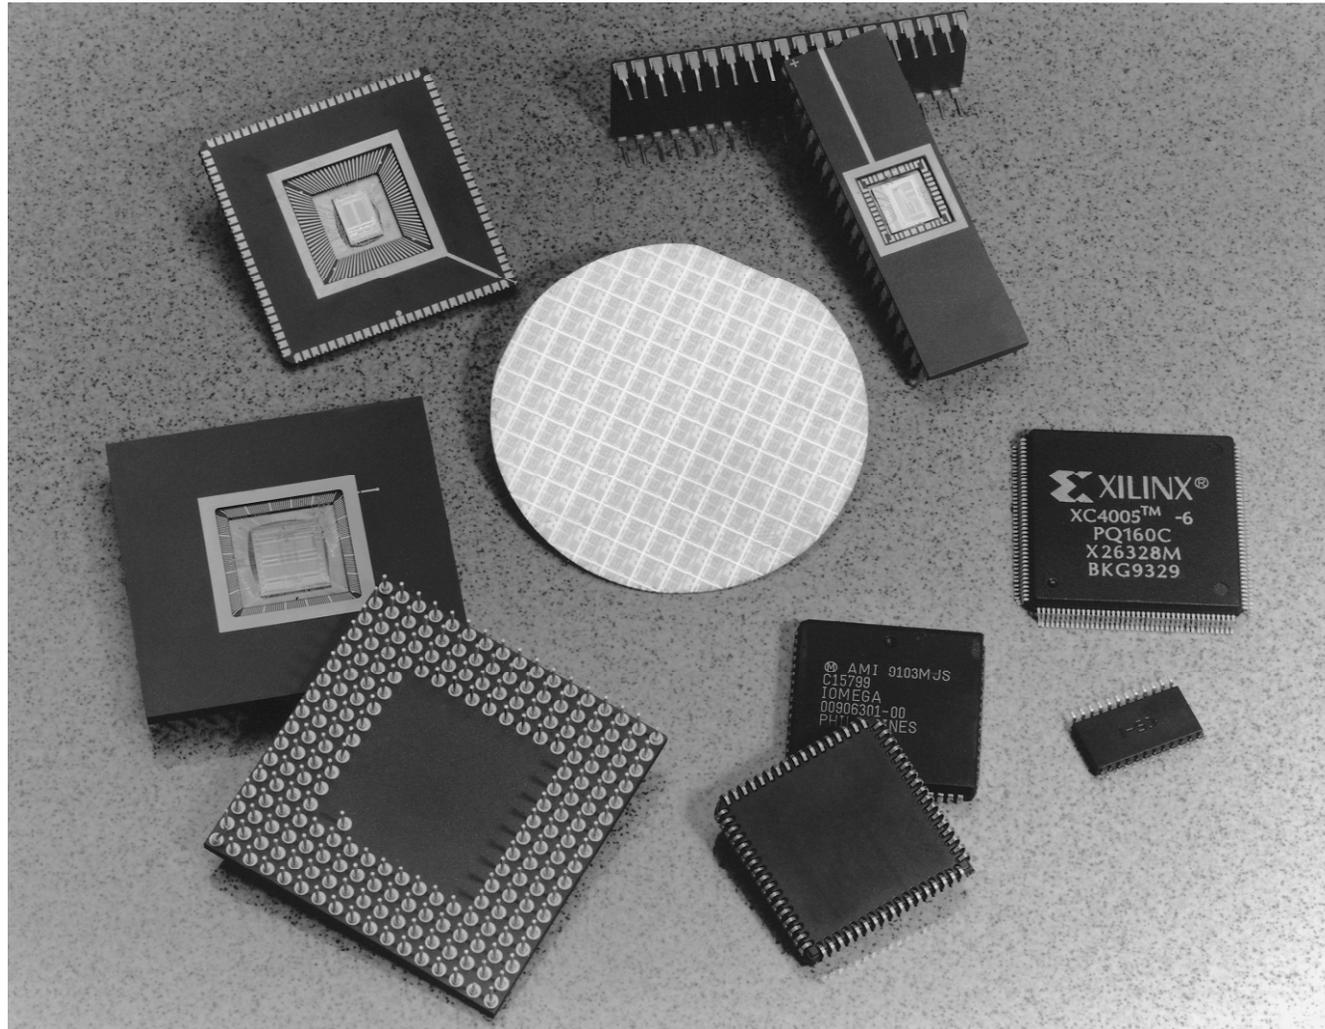

# Packaging Requirements

- Electrical: Low parasitics
- Mechanical: Reliable and robust
- Thermal: Efficient heat removal
- Economical: Cheap

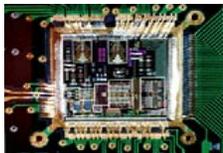

# Package Types

# Package Parameters

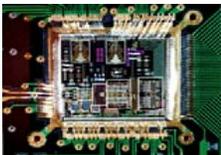

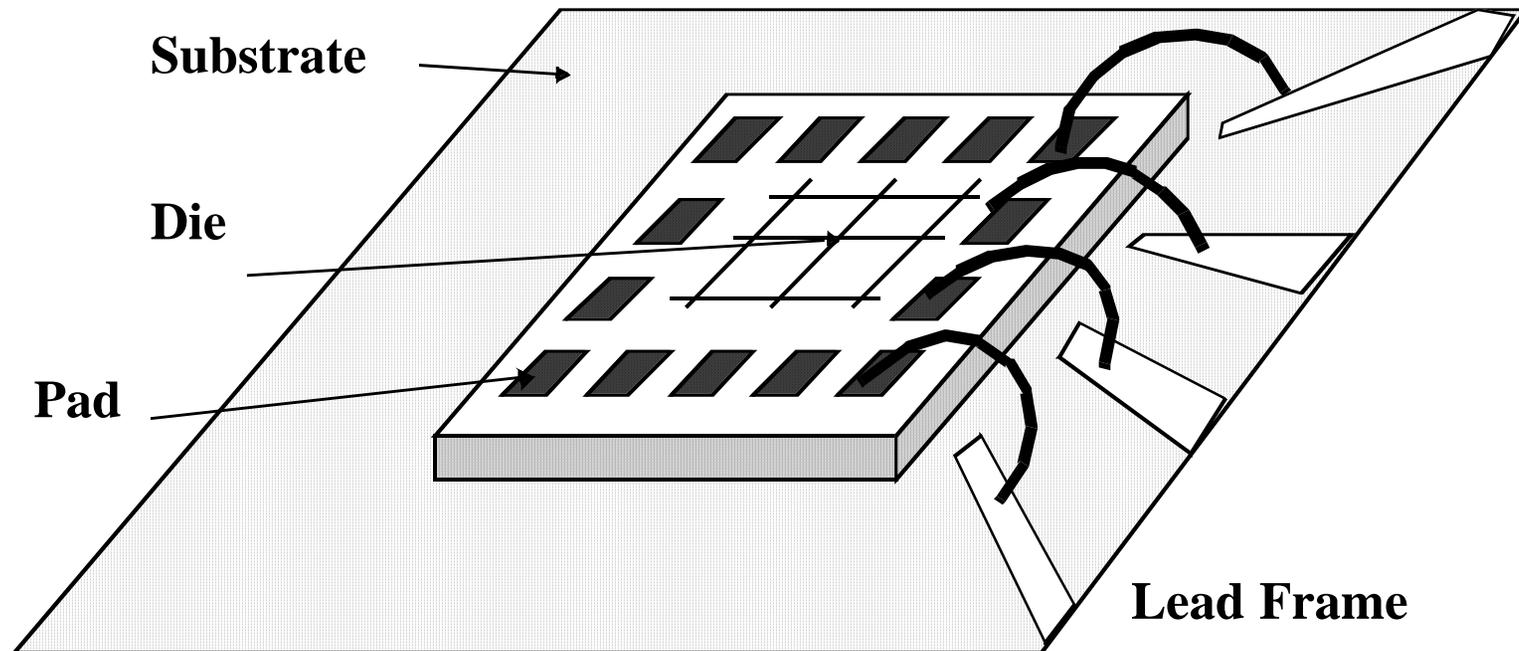

<b>Package Type</b>	<b>Capacitance (pF)</b>	<b>Inductance (nH)</b>
<b>68 Pin Plastic DIP</b>	<b>4</b>	<b>35</b>
<b>68 Pin Ceramic DIP</b>	<b>7</b>	<b>20</b>
<b>256 Pin Pin Grid Array</b>	<b>5</b>	<b>15</b>
<b>Wire Bond</b>	<b>1</b>	<b>1</b>
<b>Solder Bump</b>	<b>0.5</b>	<b>0.1</b>

Typical Capacitances and Inductances of Various Package and Bonding Styles (from [Sze83])

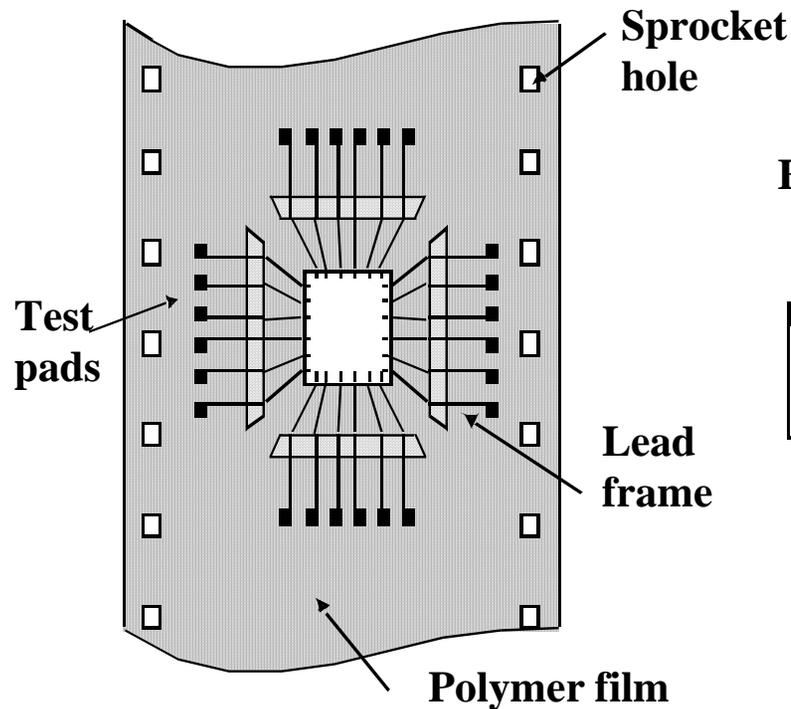

# Bonding Techniques

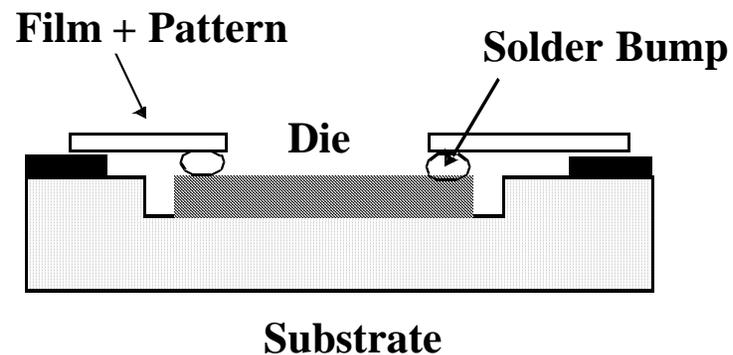

## Wire Bonding

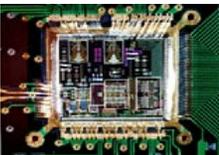

# Tape-Automated Bonding (TAB)

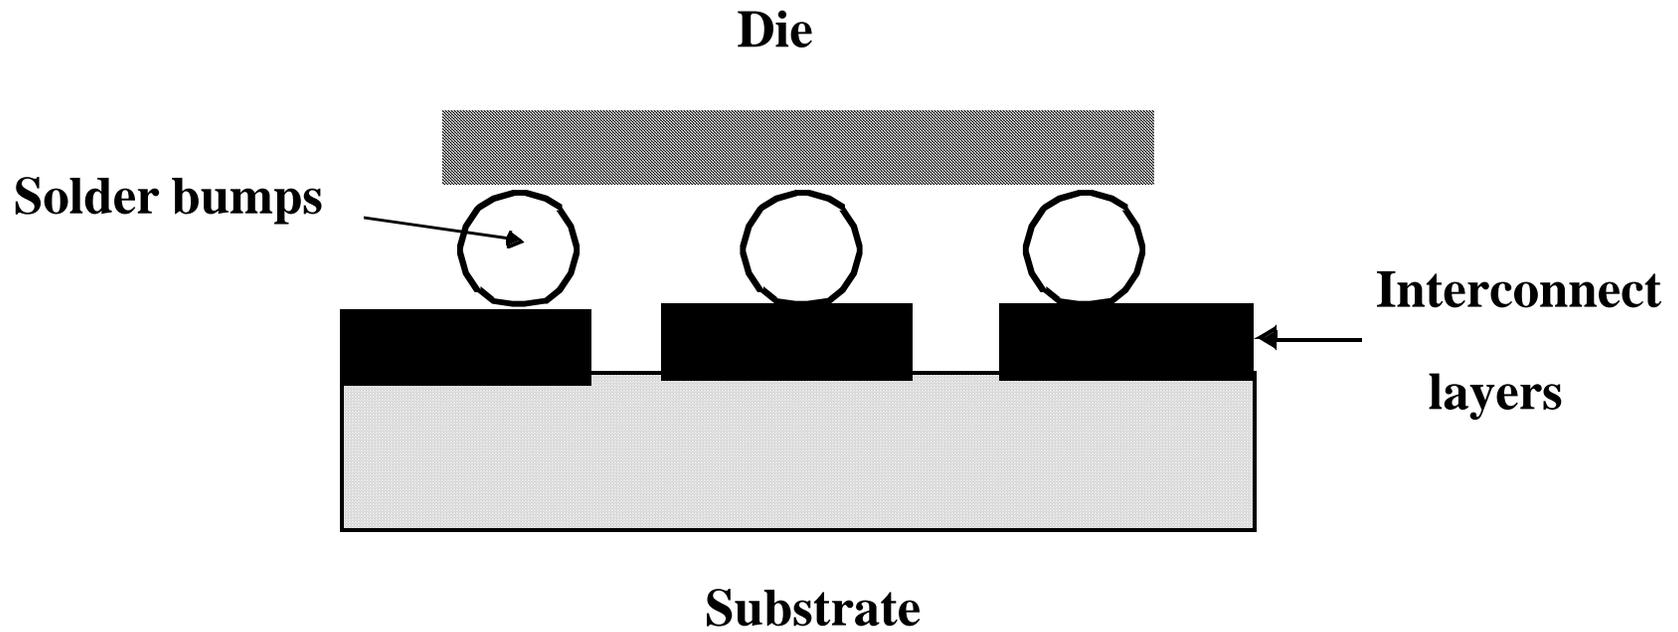

(a) Polymer Tape with imprinted wiring pattern.

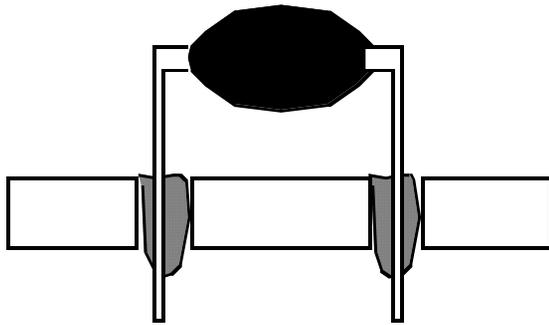

(b) Die attachment using solder bumps.

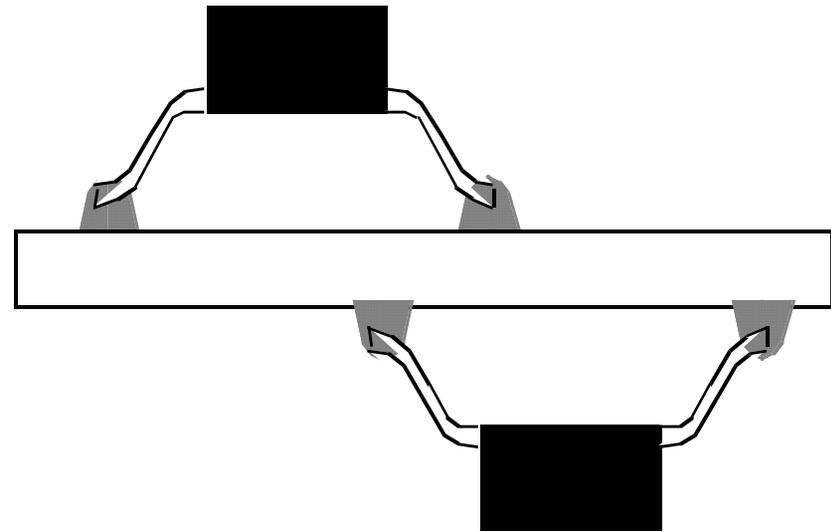

# Flip-Chip Bonding

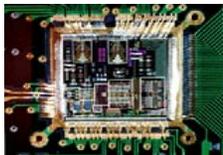

# Package-to-Board Interconnect

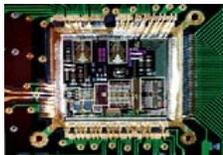

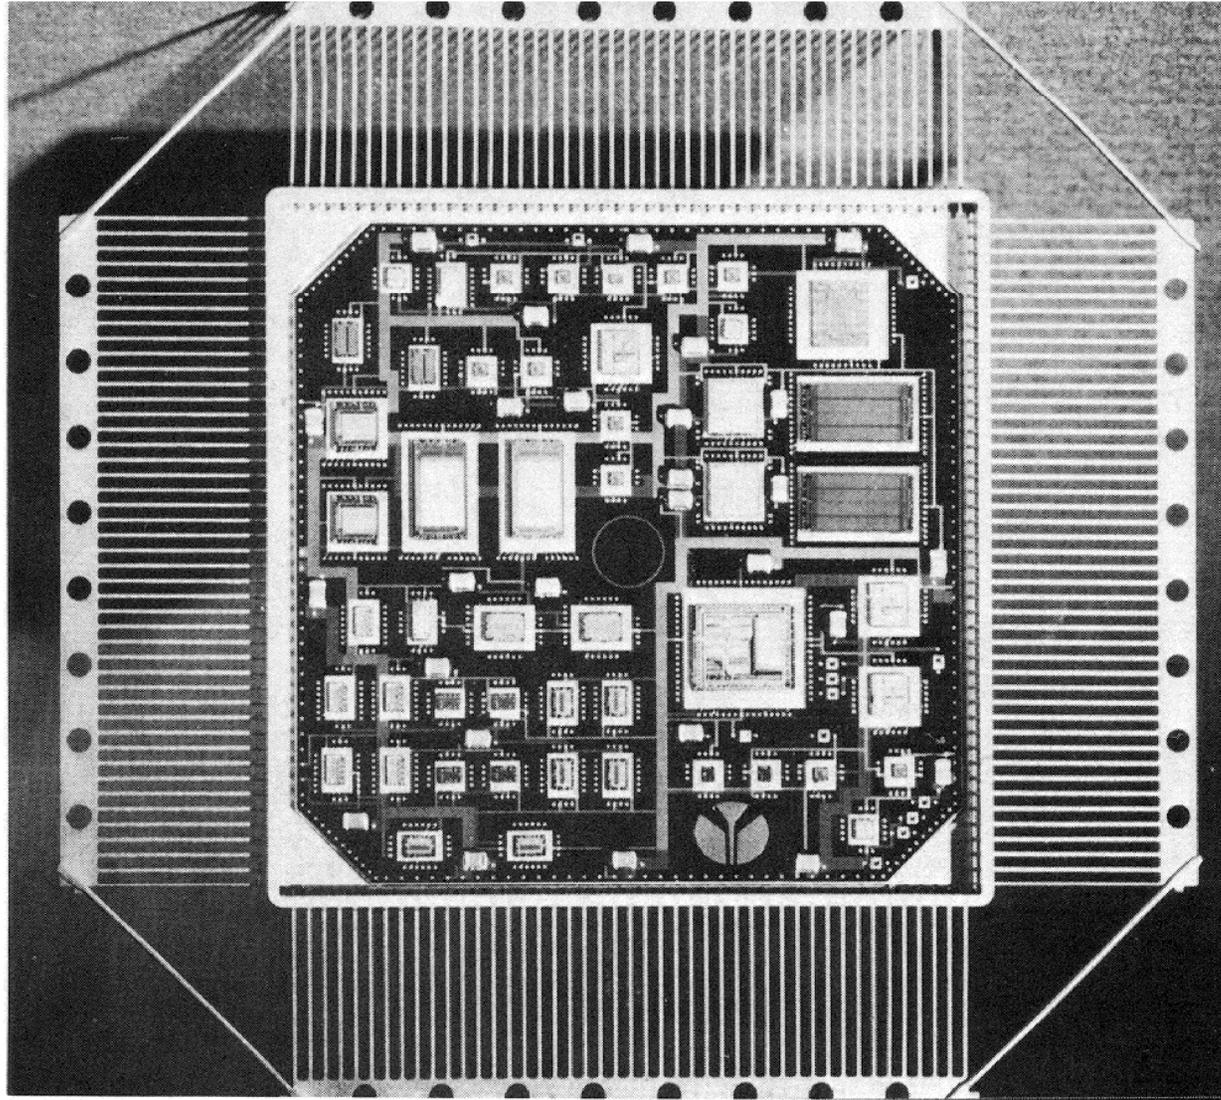

(a) Through-Hole Mounting

(b) Surface Mount

# Multi-Chip Modules

# Testing

- Test that chip operates
  - Design errors
  - Manufacturing errors
- A single dust particle or wafer defect kills a die
  - Yields from 90% to  $< 10\%$
  - Depends on die size, maturity of process
  - Test each part before shipping to customer
